

PMSM Field-Oriented Control (FOC) in MATLAB & Simulink

*Build a Complete Closed-Loop Motor Control System
from First Principles*

eMotorlabs.com

Table of Contents

Chapter 1: PMSM Open-Loop Model (ABC Frame) in Simulink

- 1.1 Introduction to PMSM and Basic Electrical Circuit Model
- 1.2 Comparing SPM and Interior Permanent Magnet Machines
- 1.3 MATLAB and Simulink Environment Setup
- 1.4 Essential Simulink Blocks and RL Circuit Modeling
- 1.5 Mechanical and Electrical Quantity Relationships
- 1.6 The Rotating Magnetic Field in Three-Phase Machines
- 1.7 Back EMF, Torque Production, and Phasor Diagrams
- 1.8 Mechanical Model and the Equation of Motion
- 1.9 High-Level Overview of the Coupled Electromechanical System
- 1.10 Machine Parameters and Voltage Relationships
- 1.11 Developing the Back EMF Subsystem
- 1.12 Developing the Power Supply Subsystem
- 1.13 Developing the Electrical Model Subsystem
- 1.14 Developing the Electromagnetic Torque Subsystem
- 1.15 Developing the Mechanical Dynamics Subsystem
- 1.16 Closing the Feedback Loop: Scaling and Modulo Blocks
- 1.17 Model Verification: No-Load and Load Testing
- 1.18 Chapter 1 Summary and Limitations of Open-Loop Operation

Chapter 2: Clarke & Park Transforms: Building the dq-Frame PMSM Model

- 2.1 Introduction to DQ Transformation and Field Oriented Control
- 2.2 Deriving the Clark Transformation
- 2.3 Deriving the Park Transformation and DQ Torque Modelling
- 2.4 Deriving the DQ Voltage Equations and Coupling Terms
- 2.5 Building the DQ Frame Motor Model in Simulink
- 2.6 Chapter 2 Summary and Introduction to Current Control

Chapter 3: PMSM Current Control: PI Controllers, Decoupling & Anti-Windup

- 3.1 Introduction to Closed-Loop Current Control
- 3.2 PI Control Theory and Pole-Zero Cancellation
- 3.3 Building PI Controllers and Decoupling in Simulink

- 3.4 Hardware Protection: Limiters and Anti-Windup
- 3.5 Verification and System Testing
- 3.6 Chapter 3 Summary and Review

Chapter 4: Closed-Loop Field-Oriented Control (FOC): Adding the Speed Controller

- 4.1 Introduction to Closed-Loop Speed Control
- 4.2 Mechanical Plant Modeling and PI Design
- 4.3 Implementing the Speed Controller in Simulink
- 4.4 Speed Loop Testing and Verification
- 4.5 Chapter Summary and Key Takeaways

Chapter 5: SVPWM & Inverter Modeling: Completing the FOC Power Stage

- 5.1 Introduction to Modulation and the Inverter Stage
- 5.2 Implementing the Inverse Park Transform
- 5.3 Space Vector PWM Theory and the Voltage Hexagon
- 5.4 Calculating Voltage Magnitude and Angle
- 5.5 Sector Detection and Dwell Time Calculation
- 5.6 Mapping Dwell Times to Duty Cycles
- 5.7 Carrier Comparison and PWM Generation
- 5.8 Building the Physical Inverter Model
- 5.9 Full Closed-Loop System Integration and Verification
- 5.10 Course Conclusion and Future Milestones
